

Save Time and Money on Job Sites with Tensar® TriAx® Geogrid

For more than two decades, Tensar® Geogrids have helped contractors improve their bottom line by saving them time, money and materials. TriAx® Geogrids save money since they are easier to install, use less aggregate fill and require no skilled labor or specialized equipment. With TriAx Geogrids you can:

- ▶ **Improve Site Access:** TriAx Geogrids help you get onto the site, even with wet weather or poor soil conditions.
- ▶ **Reduce Cut and Fill:** Work on top of weak soils by adding a mechanically stabilized layer of TriAx Geogrid and aggregate fill. The result – less undercutting, backfilling and disposal costs.
- ▶ **Reduce Aggregate Fill Thickness:** A reduction in aggregate thickness can be achieved through the use of TriAx Geogrids, with no change to the road's performance.

- ▶ **Value Engineer for Profit:** Construct a reliable but thinner base course without sacrificing durability and without expensive reconstruction or utility re-routing. TriAx Geogrids can help to fast-track projects with high costs associated with aggregate fill, over-excavation or haul off.
- ▶ **Reduce Maintenance:** Once installed, a mechanically stabilized layer utilizing TriAx Geogrid requires less maintenance than a surface underlain by geotextile fabric.
- ▶ **Simplify Installation:** TriAx Geogrids are lightweight, easy to handle and easy to cut in the field. TriAx Geogrids normally don't require any connection, since aggregate fill simultaneously interlocks with overlapping geogrid apertures. A simple overlap is sufficient and no sewing is required.
